ISSUE NUMBER 69/SEPTEMBER 2015

Fertility Rates Vary by Age and Income in New York State, Part 2: Regional Patterns

by Robin Blakely-Armitage and Jan Vink, Cornell University

As highlighted in our last NY Minute (Issue 68/July 2015), the number and timing of births women experience varies according to their age and income level, among other factors. We reported these patterns and trends over the past decade for New York State as a whole. But distinct regional differences also exist across the state. Fertility rates among women in the bottom 20% of income are relatively high in the Mohawk Valley and Mid-Hudson regions, and to a lesser extent in the North Country and Central New York regions. Long Island and the Southern Tier have the lowest relative fertility rates for low income women. For women in the top 20% of income the regional differences are not as striking, with the exception of the Mohawk Valley, where higher income women have dramatically lower fertility rates.

Note: The total fertility rate is the average number of children that would be born to a woman over her lifetime if she were to experience the exact current age-specific fertility rates through her reproductive lifetime (15-49).
